# Introducing Grab and Go

Keep your workforce productive with self-service Chromebooks

Suppose one of your employees spills hot coffee all over their laptop, leaves it on the bus, or out of nowhere, it just dies. What happens next? They're either going to spend hours, maybe days, on the sidelines waiting for a new device, or urgently need to redirect valuable IT resources to correct the issue.

Grab and Go, powered by Chrome Enterprise, makes it easy for employees to pick up a Chromebook and get to work in seconds. It is an entirely self-service program designed to keep employees productive without the need for IT assistance.

How it works:

1. **Self-service:** Centrally located racks of fully charged Chromebooks are readily available to borrow by any employee with a corporate account.

2. **Quick sign-in:** The employee signs into the Chromebook and the appropriate company management policies are immediately applied upon startup. Thanks to Chrome Sync, all of the employees bookmarks, passwords, extensions, history, and personal settings are also available.

3. **Effortless return:** When finished, the employee simply logs out and places the device back on the shelf. No resets or imaging are required because Chrome OS encrypts individual user profiles by default and data is wiped at the end of each session.

4. **24/7 access:** Because there is no check-in/out process or need for assistance from the IT department at any stage throughout the journey, devices are readily accessible for employees anytime.

An experience only Chrome OS can provide:

Built for cloud-based workflows: Users are back up and running in the time it takes to enter a password, with instant access to the tools and data they need via their Google Account and Chrome Sync.

Easy to scale: Chromebooks are easy to set up, and don't need to be reset or configured between uses.

Built for Security: Chromebooks are designed to be secure, even as shared devices, with features such as encrypted profiles, verified boot, automatic background updates, and sign-in restrictions.

Benefits:

Employee productivity gets a boost due to increased autonomy and reduced reliance on a single device. This means your employees don't have to put up with disruptive troubleshooting nor technology barriers.

For IT administrators, on-boarding the program is also almost instant due to Chrome's built-in features, which enable inter-device functionality with our cloud-native OS. In addition, IT administrators no longer need to waste time on inventory issues, and instead can focus on your larger business challenges and driving the company forward.

Use Cases:

- **Loaner program:** Keep employees productive when they break or forget their device.

- **Frontline Cloud Workers**: Easy to share between employees whether on the manufacturing floor or using point of sale workstations.

- **Cloud Workers on the go:** Perfect for long business trips or use between meetings on a busy day.

- **Thin client replacement**: Seamless integration with popular SaaS applications.
